DETAILED ACTION

Allowable Subject Matter

1. Claims 1-18 and 31-36 are considered allowable over the cited prior art of record.

The following is an examiner's statement of reasons for allowance:

The main cited prior art references cited, Stapleton et al. (US 6,523,070), hereinafter Stapleton, and Poulter et al. (US 6,603,741 B1), hereinafter Poulter, and other prior art fail to teach or suggest all of the claim limitations. Stapleton teaches an apparatus being a communication device including the use of discrete signal wires in addition to the communications signal wires to determine the position of the devices in the stack/chain. Moreover, Stapleton discloses additional electronic circuitry that sends a pulse down the additional wire whereas each device adds to the length of the pulse. Then the length of the pulse is used to determine the devices position in the stack/chain. Additionally, Stapleton provides yet another signal wire and electronic circuitry that senses the current to determine if a device is at the top or bottom (end) of the stack/chain. And more distinctly, Stapleton discloses utilizing a parallel communications interface (1a, 1b, 2a and 2b in Fig. 5 and col. 5, lines 3-23) instead of a series cascading communications interface as shown in Fig. 2 at 24(1) and 25(1), for example, of the claimed invention. With respect to Poulter, Poulter teaches packet-based data communication networks utilizing an Ethernet or similar network. This data may be transferred between devices at at least two different rates via port 2 and link or cable 3 as shown in FIG. 2. The devices being able to establish a selected data rate by means of auto-negotiation (see, FIG. 3).

The combination of the cited prior art fail to teach or suggest the combinations of features recited in independent claims 1, 7 and 13. More particularly, neither Stapleton nor Poulter disclose the claimed features of "monitoring, at each of the cascadedly arranged controllers, each of the plurality of communication channels between the controller and the server, wherein the n inputs of each succeeding controller in the cascade are respectively connected in series to n outputs of a preceding one of the controllers," and further the "determining whether at least one of the plurality of communication channels is being used for the transmission of link pulses generated by the server, wherein the presence of link pulses on one of the communication channels indicates that that particular communication channel and the respective port on the server are not currently being used for data transmission by the server and are available" as recited in amended claims 1 and 7, and similar features set forth with respect to a system in independent claim 13.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Benjamin Ailes whose telephone number is (571)272-3899. The examiner can normally be reached Monday-Friday, 5:30-8:30AM, 1:00-6:00PM, IFP Hoteling schedule.
